

Abstract

A method and system provides for scanning a check and/or cash to create an electronic image of the front and the back of the check and/or cash. The image is then processed and transmitted electronically to a central location. The image may be recreated 5 into a paper form at the central location, resembling the original paper check or cash, including a machine-readable regeneration of the MICR code line data captured from the original instrument. Paperless processing of checks and cash is thus provided, including local voiding and storage of the check without requiring immediate pickup, while still allowing the transaction to be process.
